DFS/BFS	<code>x/y</code>	<code>inGrid(x,y,n,m)</code>
字符串	<code>int</code> <code>32</code>	<code>long long</code>

□□□□□□□□□□

1□□□□□□

```
inline bool inGrid(int x, int y, int n, int m) {
    return x >= 0 && x < n && y >= 0 && y < m;
}
```

2□□□□□□□□□□ **>= target** □

```
int lowerBound(const vector<int>& a, int target) {
    int l = 0, r = (int)a.size(); // [l, r)
    while (l < r) {
        int mid = l + (r - l) / 2;
        if (a[mid] >= target) r = mid;
        else l = mid + 1;
    }
    return l; // □□□□ a.size()
}
```

3□□□□□□□□□□ **0-indexed** □

```
vector<long long> buildPrefix(const vector<int>& a) {
    int n = a.size();
    vector<long long> pre(n + 1, 0);
    for (int i = 0; i < n; i++) pre[i + 1] = pre[i] + a[i];
    return pre;
}

long long rangeSum(const vector<long long>& pre, int l, int r) {
    return pre[r + 1] - pre[l];
}
```

4□□□□□□□□□□□□

```
int dx[4] = {-1, 1, 0, 0};
int dy[4] = {0, 0, -1, 1};
```

5□□□□□□□□□□□□/□□□□

□□□□□□□□□□□□□□□□□□□□□□□□□□□□□□□□

```
vector<vector<int>> a = {{2, 3}, {1, 5}, {2, 1}, {1, 2}};
sort(a.begin(), a.end(), [](const vector<int>& x, const vector<int>& y) {
    if (x[0] != y[0]) return x[0] < y[0]; // □□□□

```

```
return x[1] < y[1];          // 比较
});
```

使用 `vector<pair<int,int>>` 存储，使用 `sort(v.begin(), v.end())` 排序，first 和 second 分别表示

11. STL 容器

STL 容器 API 非常强大，使用非常灵活

1. vector / string

- `vector` 容器支持 `resize` 和 `size()` 方法
- `string` 容器支持 `reverse` 和 `sort` 方法

```
vector<int> a;
a.push_back(3);
a.pop_back();
a.resize(10, 0);
int n = a.size();

string s = "abc";
s += 'd';
reverse(s.begin(), s.end());
```

2. set / map

- `unique` 函数用于去除重复元素，配合 `sort` 和 `erase` 使用
- 使用 `set` 或 `map` 容器可以方便地实现去重

```
sort(a.begin(), a.end());
sort(a.begin(), a.end(), greater<int>()); // 降序

a.erase(unique(a.begin(), a.end()), a.end()); // 删除重复元素
reverse(a.begin(), a.end());
```

3. binary_search

- 使用 `API` 可以快速查找元素，返回 `end()` 表示未找到

```
auto it1 = lower_bound(a.begin(), a.end(), x); // 第一个 >= x 的位置
auto it2 = upper_bound(a.begin(), a.end(), x); // 第一个 > x 的位置
bool has = binary_search(a.begin(), a.end(), x);
```

4. map / unordered_map

- `map` 容器使用红黑树实现，时间复杂度为 $O(\log n)$ ；`unordered_map` 使用哈希表实现，时间复杂度为 $O(1)$

- `count`

```
unordered_map<int, int> cnt;
for (int x : a) cnt[x]++;

if (cnt.count(5)) {
    // 5
}
```

5 `queue` / `stack` / `deque`

- `queue` `stack` `deque`
- `if (!q.empty()) ...`

```
queue<int> q; q.push(1); q.front(); q.pop();
stack<int> st; st.push(1); st.top(); st.pop();
deque<int> dq; dq.push_back(1); dq.push_front(2);
```

6 `priority_queue`

- `greater<T>`
- `"<T, vector<T>, greater<T>>"`

```
priority_queue<int> maxHeap; //
priority_queue<int, vector<int>, greater<int>> minHeap; //
```

7 `accumulate` / `max_element` / `min_element`

- `accumulate` `0LL`
- `max_element/min_element`

```
long long sum = accumulate(a.begin(), a.end(), 0LL);
int mx = *max_element(a.begin(), a.end());
int mn = *min_element(a.begin(), a.end());

iota(a.begin(), a.end(), 0); // 0,1,2,...
```

8 `isalpha` / `isdigit` / `islower` / `isupper` / `tolower` / `toupper` / `ASCII`

- `isalpha/isdigit/islower/isupper` `#include <cctype>`
- `char` `ASCII` `tolower/toupper`
- `vector<int>(128)` `ASCII` `unordered_map<char, int>`

```
string s = "aB9z";

for (char &c : s) {
    if (isalpha(c)) {
        c = tolower(c); //
    }
}
```

```
vector<int> cnt(128, 0);    // ASCII []
for (char c : s) cnt[(int)c]++;

int codeA = (int)'A';      // 65
char ch = (char)(codeA + 32); // 'a'

unordered_map<char, char> mp; // []
mp['('] = ')';
mp['['] = ']';
mp['{'] = '}';
```
